STRESS

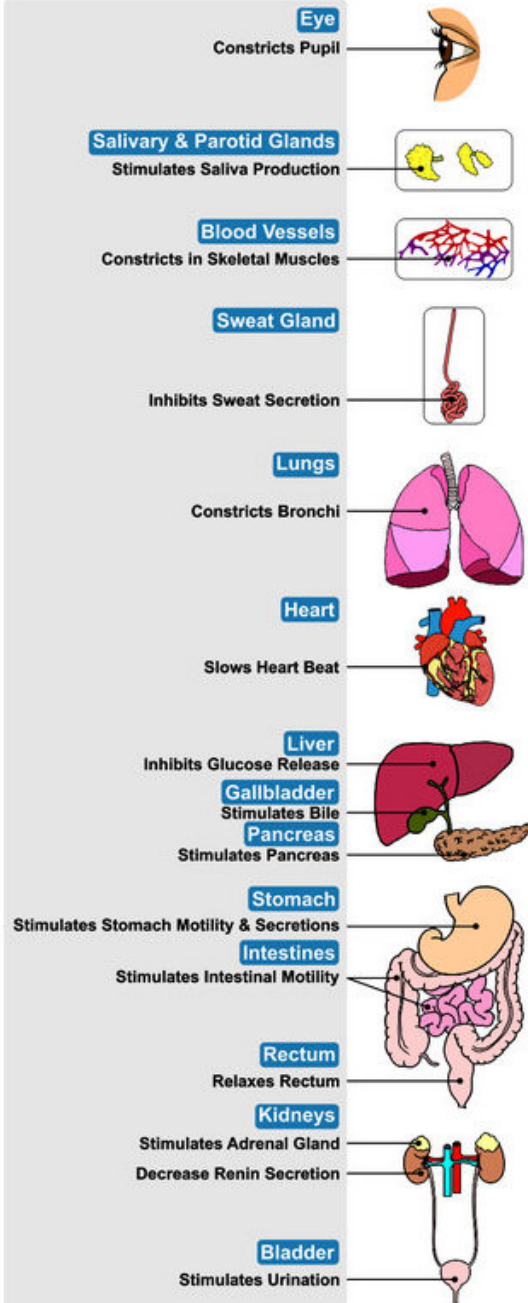

pressure or tension exerted on a material object

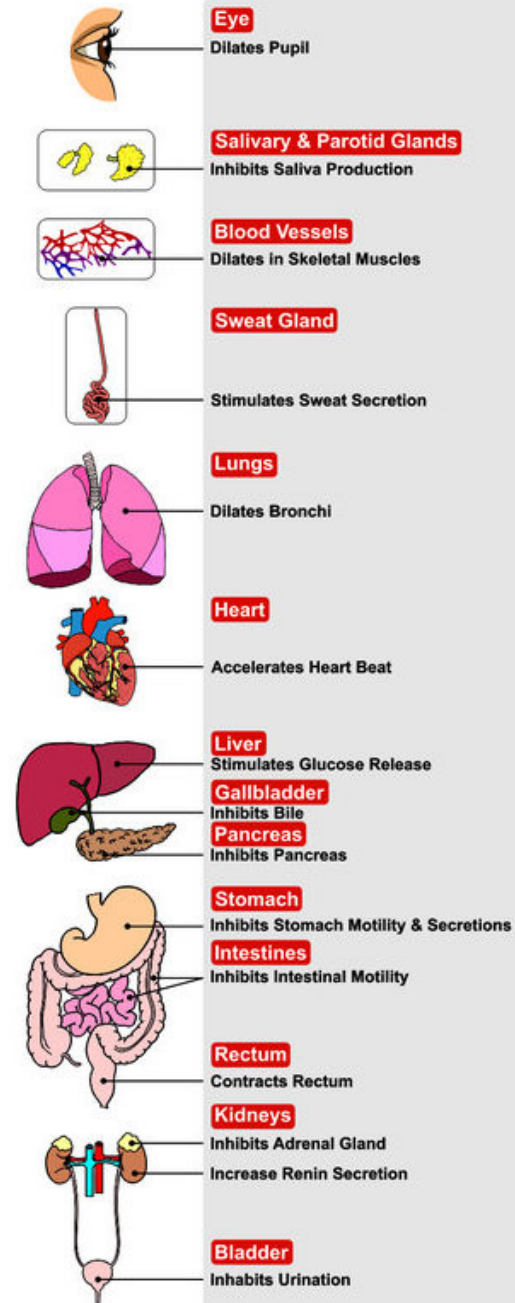

a state of mental or emotional strain or tension resulting from adverse or very demanding circumstances

PARASYMPATHETIC

SYMPATHETIC

Hypothalamic-pituitary-adrenal (HPA) system

Amygdala – detects salient information in our environment.

Hypothalamus – releases hormones that in turn stimulates the pituitary gland.

Pituitary Gland – releases hormones that in turn stimulates the adrenal gland.

Adrenal Glands – endocrine glands above the kidneys that release cortisol

Cortisol– glucocorticoid; increases blood pressure, blood glucose, and suppresses immune system.

Adverse Childhood Experiences (Early Life Stress)

- ACEs categories
 - Physical abuse and neglect
 - Emotional abuse
 - Sexual abuse
 - Interpersonal violence
 - Household psychopathology and substance abuse
 - Parental separation or divorce
- Other measures ELS
 - Childhood Trauma Questionnaire (28 items)
 - 5 subscales: physical abuse, physical neglect, emotional abuse, emotional neglect, sexual abuse. Also: denial score
 - Adds: severity of exposure (never true, rarely true, sometimes true, often true, and very often true)
 - Maltreatment and Abuse Chronology of Exposure (MACEs) scale
 - 10 subscales: emotional neglect, non-verbal emotional abuse, parental physical maltreatment, parental verbal abuse, peer emotional abuse, peer physical bullying, physical neglect, sexual abuse, witnessing interparental violence and witnessing violence to siblings
 - Adds: timelines

- Early Life Adversity (ELS) is a major public health crisis
 - More than 670,000 substantiated children and adolescents in the US
 - 1750 abuse and neglect related deaths in 2016
 - \$120+ billion in yearly cumulative costs
- Highly prevalent in Oklahoma
 - 30% - economic hardship (45th)
 - 30% - divorce (50th)
 - 17% - parental alcohol/drug abuse (49th)
 - 11% - domestic violence (50th)
 - 12% - parent with mental illness (43rd)
 - 10% - incarcerated parent (48th)
 - 13% - victims of / witnessed neighborhood violence (49th)
 - 24% - 4 or more ACEs (50th)

Percentage of Mental Health Disorders Accounted for by ELS

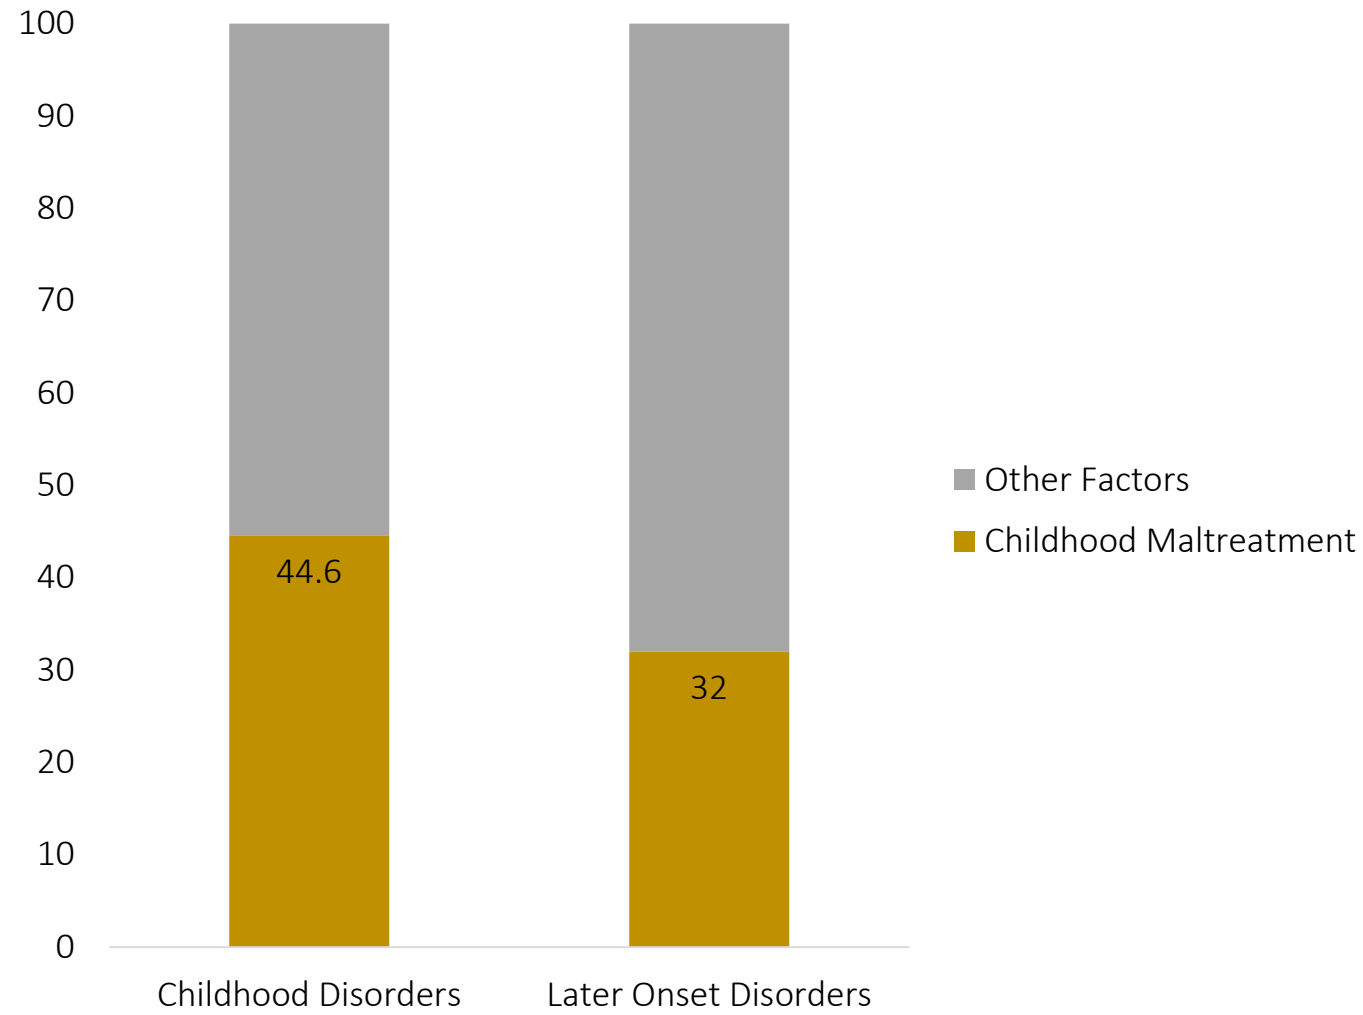

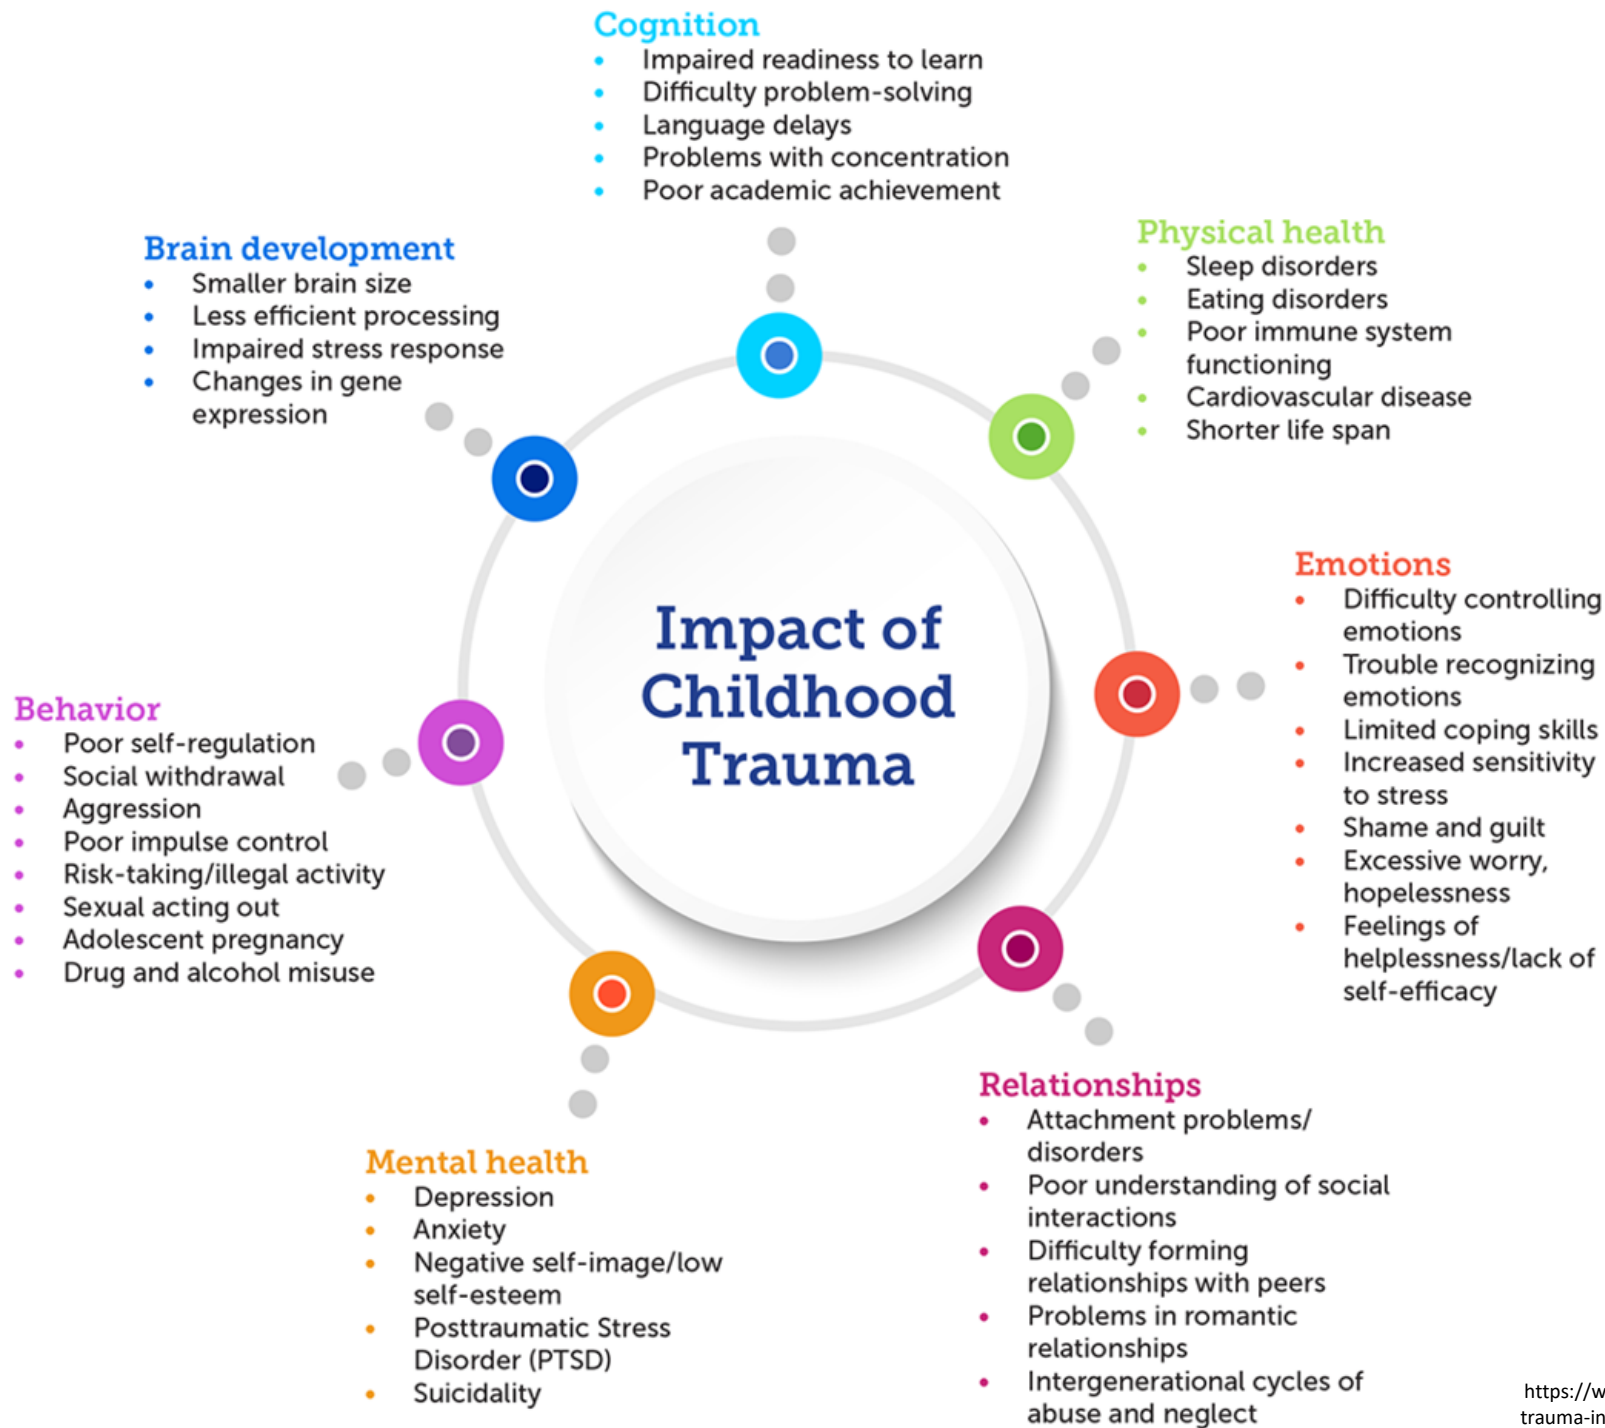

Table 1
Prevalence of each category of adverse childhood experience and reporting of additional ACEs

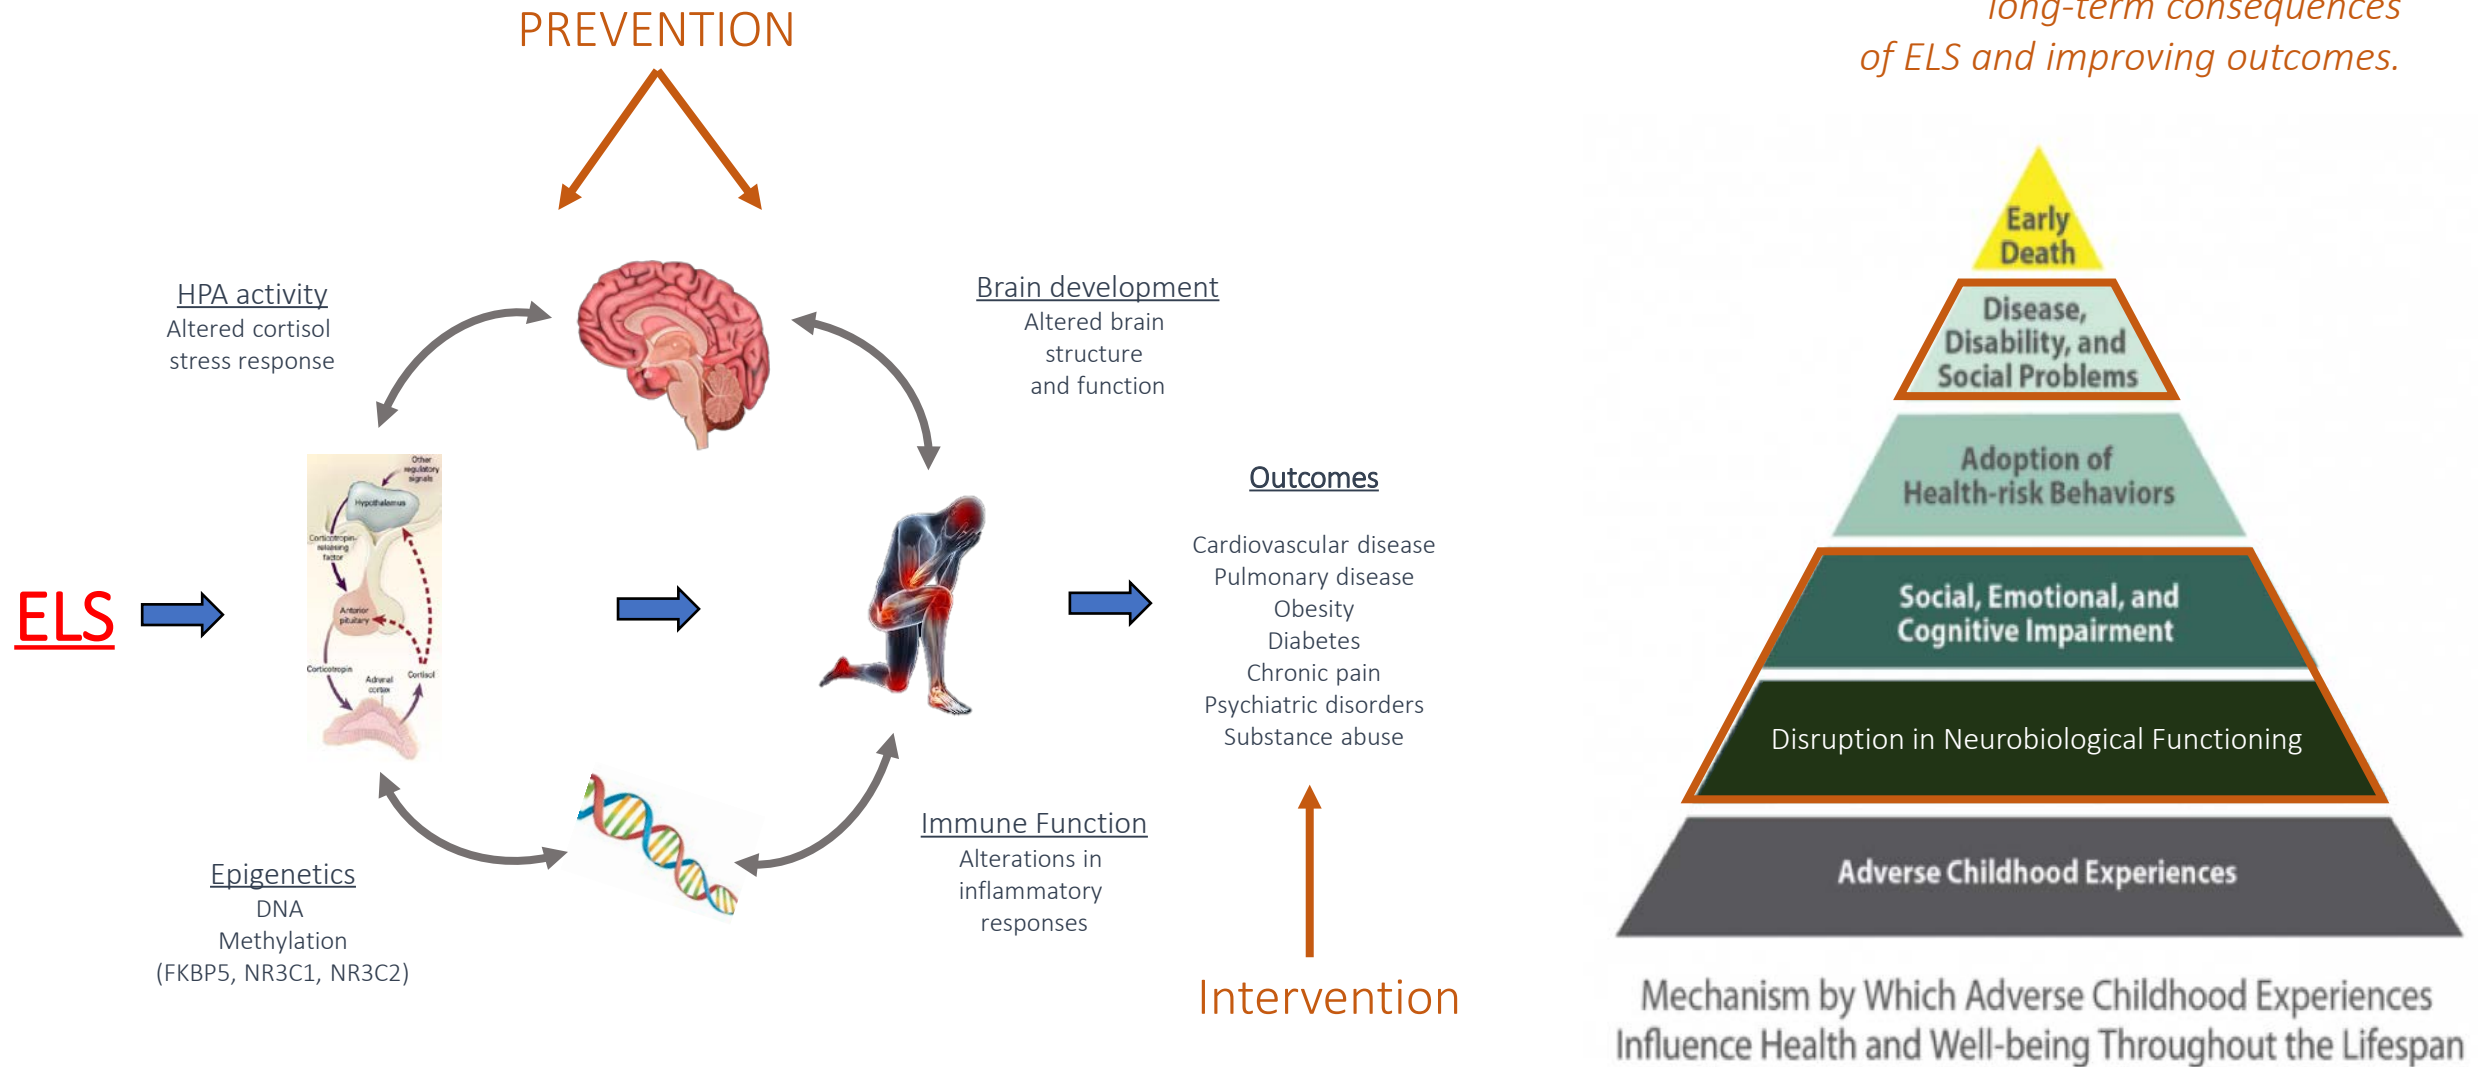

ACE category	N	Prevalence (%)	Additional ACEs (%)						
			0	≥1	≥2	≥3	≥4	≥5	≥6
Abuse									
Emotional	878	10.2	2	98	90	77	62	42	25
Physical	2,275	26.4	17	83	64	46	32	20	12
Sexual	1,812	21.0	22	78	58	42	29	19	12
Neglect									
Emotional	1,274	14.8	7	93	79	63	47	32	19
Physical	855	9.9	11	89	75	61	50	37	24
Household dysfunction									
Parental separation or divorce	1,125	13.0	18	82	61	43	30	19	12
Household substance abuse	2,435	28.2	19	81	60	41	29	18	11
Household mental illness	1,749	20.3	16	84	65	48	34	21	13
Domestic violence	2,081	24.1	5	95	82	64	48	32	20
Crime	516	6.0	10	90	74	56	43	30	23
Median			13.5	86.5	69.5	52.0	38.5	25.0	16.0
Range			2–22	78–98	58–90	41–77	29–62	18–42	11–25

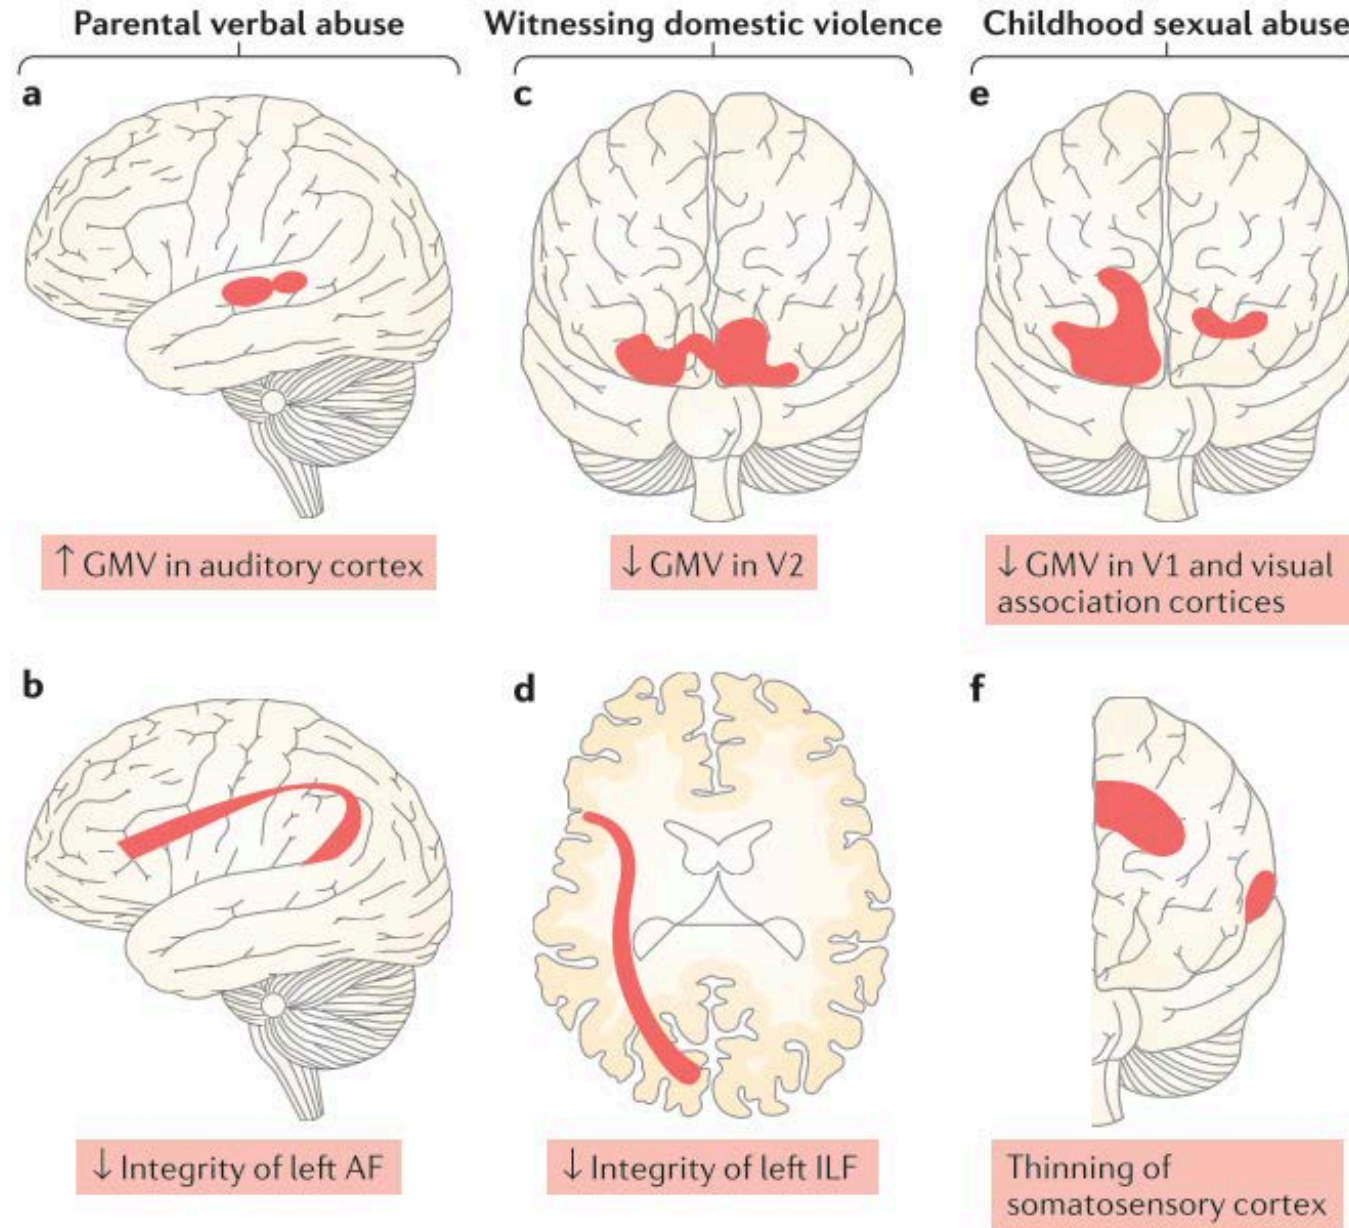

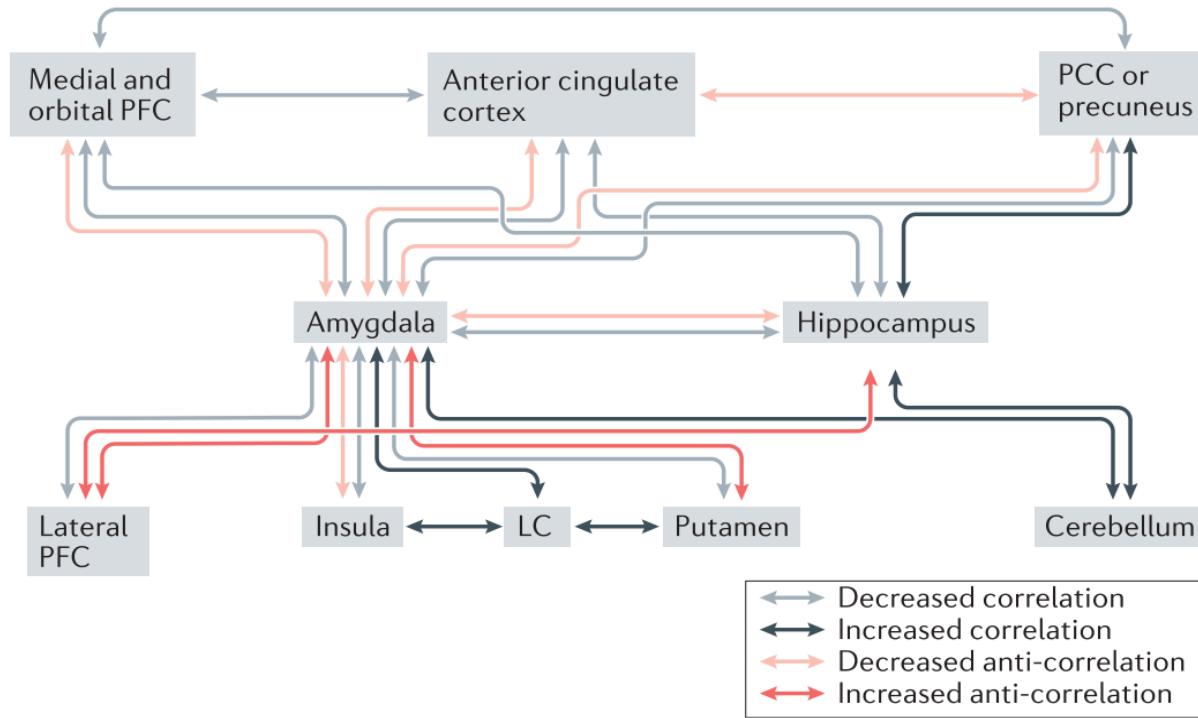

Neuroscience-based preventive intervention that target the disrupted neurobiological and psychosocial mechanisms, thereby reversing the long-term consequences of ELS and improving outcomes.

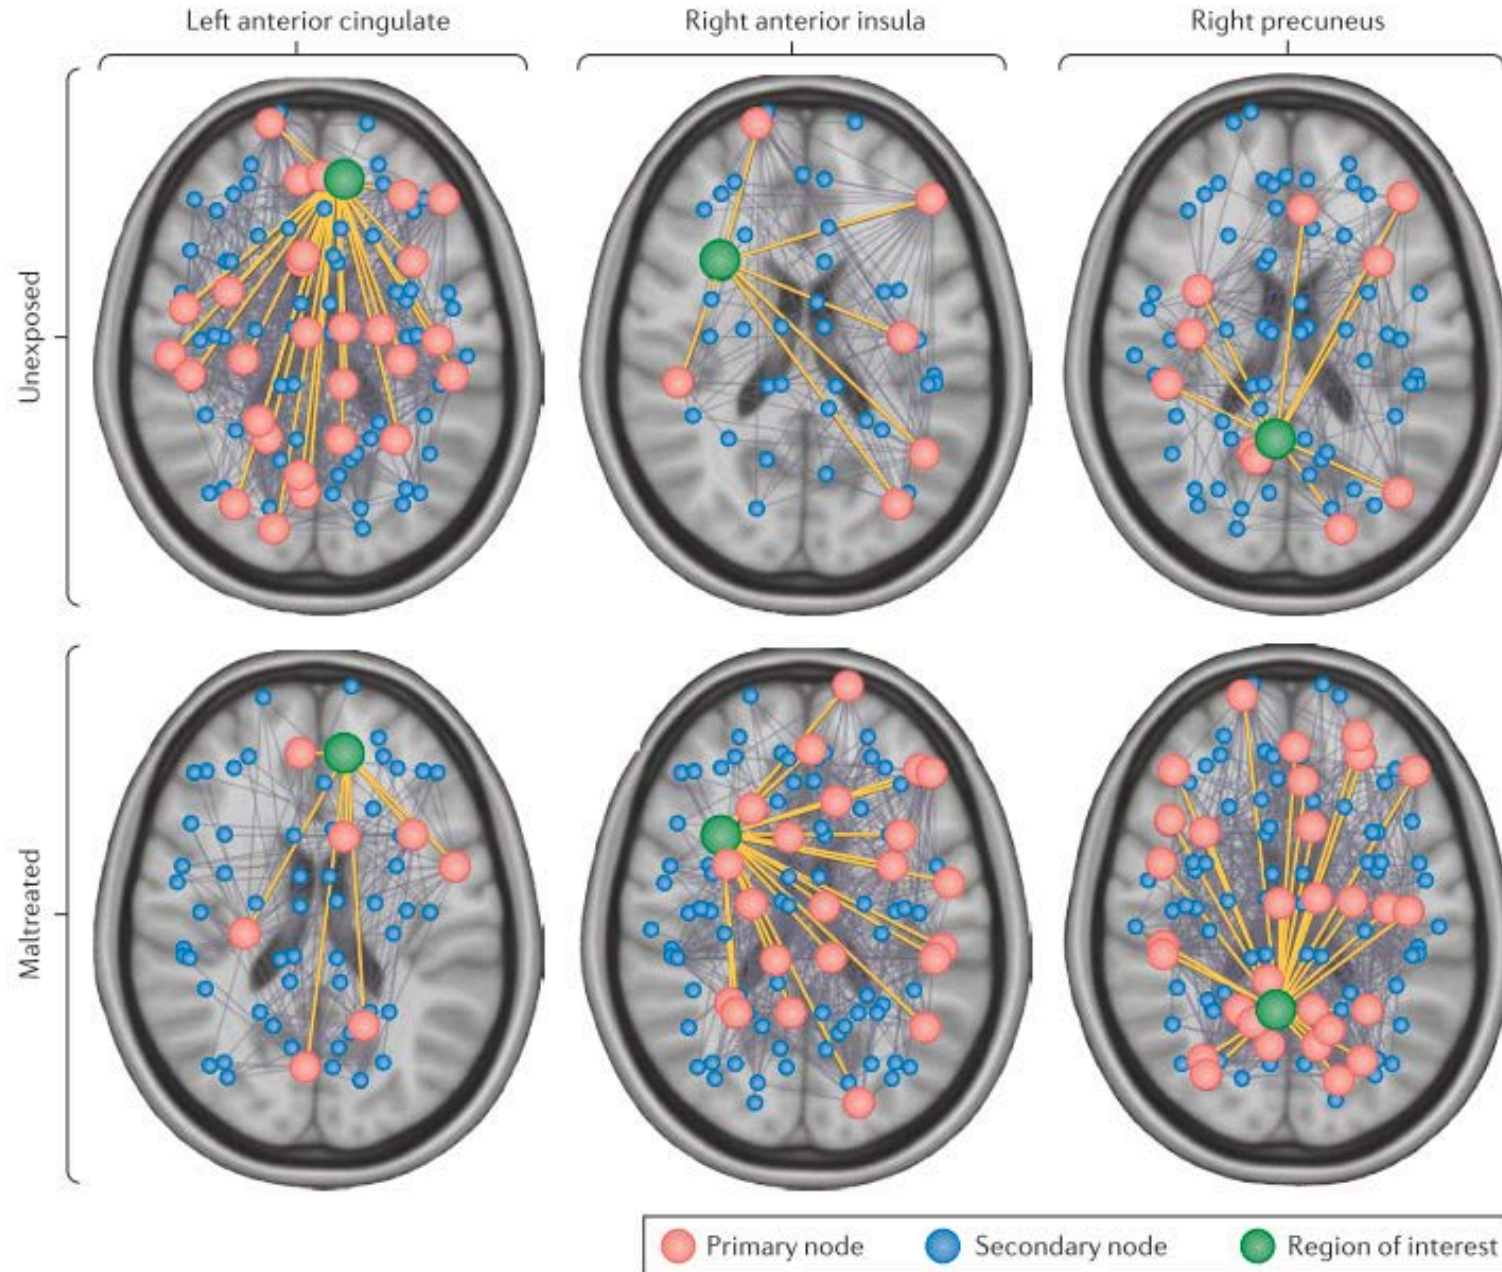

Emotion dysregulation

Reward Processing

RESILIENCE

pressure or tension exerted on a material object

(of a substance or object) able to recoil or spring back into shape after bending, stretching, or being compressed.

a state of mental or emotional strain or tension resulting from adverse or very demanding circumstances

(of a person or animal) able to withstand or recover quickly from difficult conditions.

FIGURE 1. The resilience model taught in the curriculum, *Transforming Lives Through Resilience Education*, based on the work of Carver⁵ and O’Leary and Ickovics.⁶

MINDFULNESS

is

*awareness of your thoughts,
feelings, and physical
sensations,*

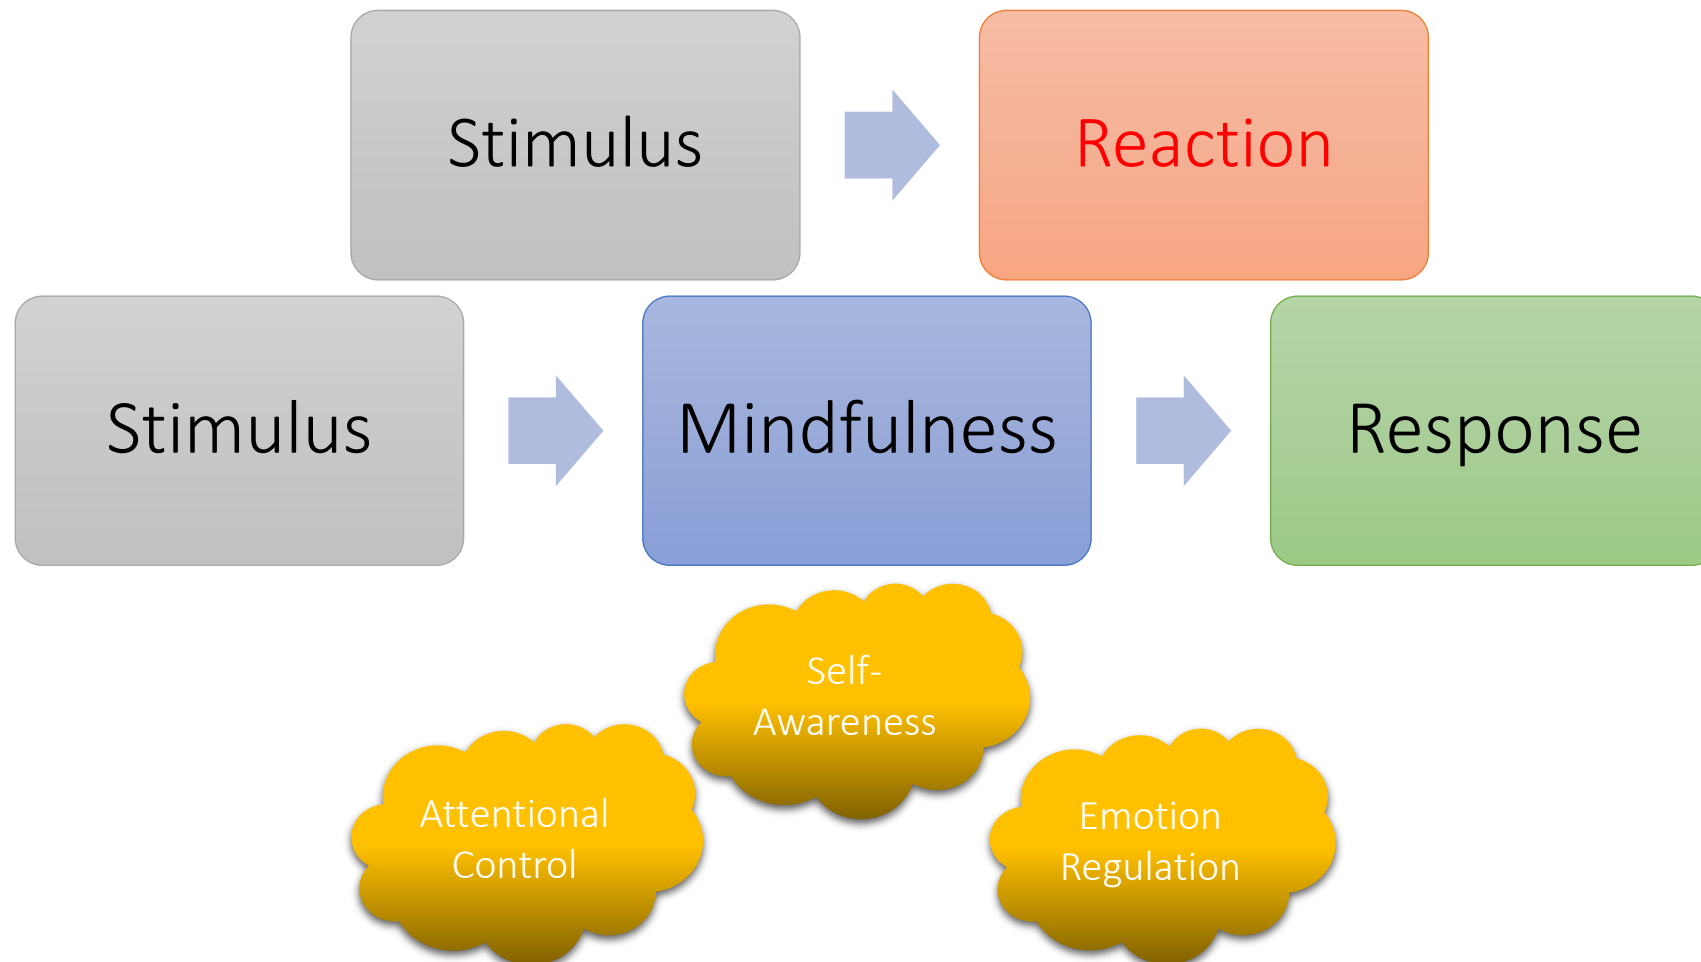

in the present moment,

and without any judgment

Promotes regulation and inhibition by teaching attentional control over actions/behaviors, emotional responses, and cognitions.

Fosters inhibition of emotional impulses, modulation of emotional behavior, and engagement in goal-directed behavior.

MINDFULNESS PRACTICE

Mindfulness Training for Resilience in Early Life (MindREaL)

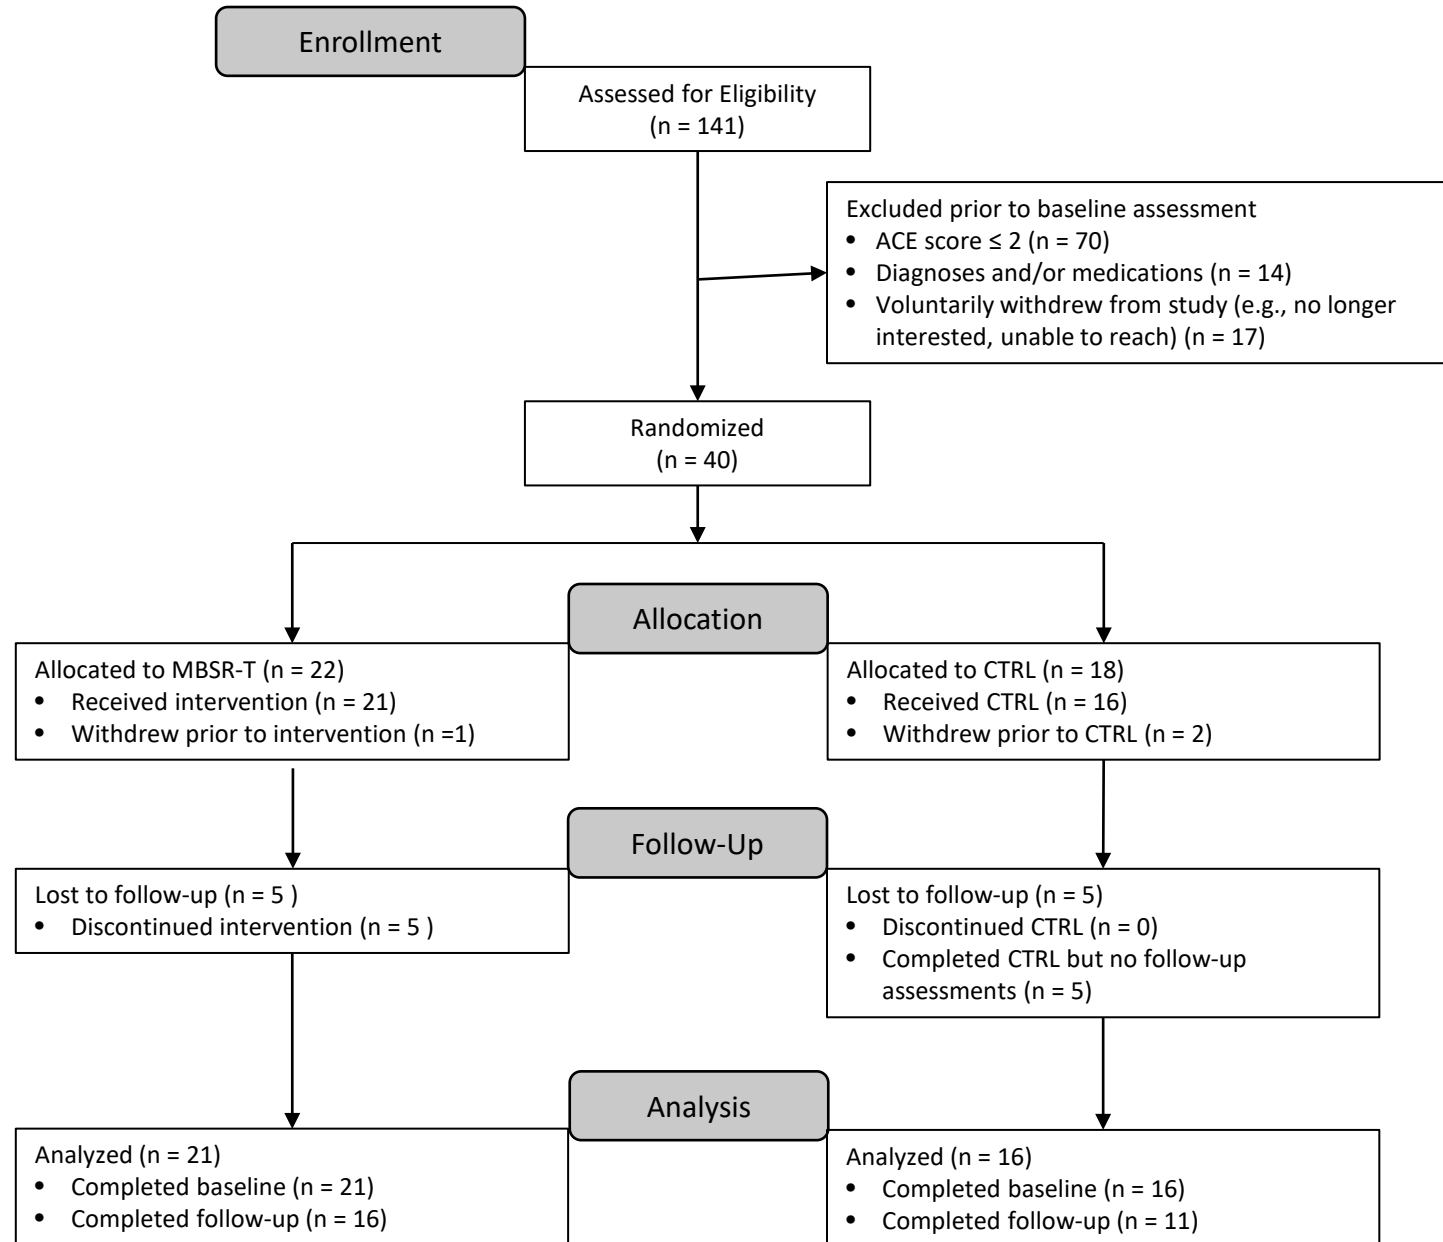

FUNDING:

Oklahoma State University Center for Health Sciences
Center for Integrative Research on Childhood Adversity (CIRCA) CoBRE Pilot Project
(5P20GM109097-04; completed)

Aims:

Identify how ELS exposure impacts affective symptoms and biological processes

Identify how mindfulness practice impacts affective symptoms and biological processes dysregulated by ELS

Age: 14.28 (.76)

Measures	Baseline	Online Assess 1	Online Assess 2	Sessions 1 – 8	Follow-Up
<p>Questionnaires: ELA Exposure (ACEs and CTQ), Alcohol and Drug Involvement, Resilience, Difficulties in Emotion Regulation, Mindfulness Attention and Awareness</p>					
<p>Symptom and Treatment Questionnaires: Mood and Feelings Questionnaire, Suicide Behaviors Questionnaire - Revised, Homework Rating Scale, Working Alliance Inventory</p>					
<p>Trier Social Stress Task Salivary Cortisol Collection Blood Collection [IL-6, CRP, TNF-alpha, FKBP5, NR3C1]</p>	 				 
<p>Treatment Allocation: MBSR-T or CTRL</p>					

Adolescent Reported at Baseline

n = 41

$$r_{s(36)} = .41, p < .01$$

$$r_{s(36)} = .34, p < .05$$

Trajectory of Therapy Alliance

$[F_{(1,28)} = 3.31, p = .079, d = .69]$
 MBSRT: $[t_{(28.2)} = -2.972, p < .01, d = 398 \ 1.40]$
 CTRL: $[t_{(29)} = -.016, p = .988, d = .01]$

MBSR-T group showed a significant decrease in depressive symptoms from baseline to follow-up, with a decreasing trend was observed over the course of treatment
 $[F_{(9,139)} = 5.27, p < .001, d = .51].$

$[F_{(1,29)} = 5.47, p = .03, d = .86]$
MBSRT: $[t_{(29)} = -.74, p = .47, d = .24]$
CTRL: $[t_{(29)} = 2.414, p = .02, d = 1.40]$

95%CI: .23 to 4.59; $p < .05$, *Cohen's d* = .39

95%CI: 1.12 to 4.53; $p < .05$, *Cohen's d* = .62

$$r_{s(36)} = -.35, p < .05$$

$$r_{s(36)} = -.27, p = .09$$

(A)

Training Effects on Cortisol During Stress Induction

$[F_{(3,86)} = 2.36, p = .077, d = .60]$
 $[t_{(111)} = 1.92, p = .058, d = -0.56]$

(B)

Training Effects on Mood During Stress Induction

$[F_{(3,86)} = 4.49, p = .006, d = .83]$
 $[t_{(108)} = 2.19, p = .031, d = -.74]$

Augmented Mindfulness Training for Resilience in Early Life (A-MindREaL)

FUNDING:

Laureate Institute for Brain Research
Neuroscience-based Mental Health Assessment and Prediction
(5P20GM121312-02) CoBRE Project

Overarching Aim:

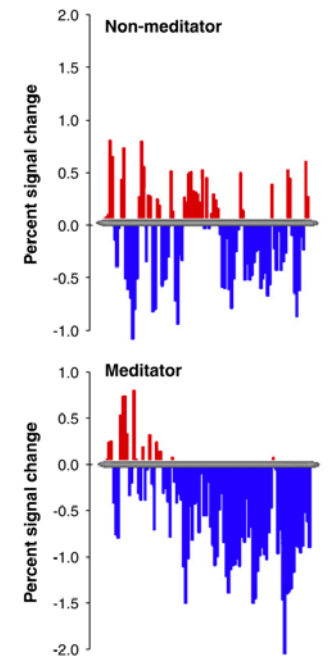

use augmented mindfulness, i.e., combined standard mindfulness training with rtfMRI neurofeedback, to influence and increase plasticity of brain areas affected by ELA, and, in turn, affect state changes in symptoms the affected youth.

Active baseline task
Do the words describe you?
30 seconds

↓

Meditate with Real-time feedback
Online PCC feedback
3 minutes

Aim 1

To establish the AMT protocol and to determine the feasibility of targeted PCC modulation in youth.

Aim 2

To determine whether ELS-exposed youth show greater difficulty engaging the PCC to facilitate mindfulness and whether neurofeedback helps to change the PCC activity.

Aim 3

To determine whether AMT results in improved state mindfulness in ELS-exposed youth.

Demographic and Medical History

Parent Trauma & Symptomatology

Clinical Interview and Assessment

- MINI
- Life Chart
- Suicidality

Self-report Measures

- Trauma
- Negative valence
- Positive valence
- Substance use
- Physical health and sleep
- Relationships / social support

Neurocognitive Assessment

- Episodic memory
- Executive attention and function

- Working memory
- Language
- Processing speed

Biomarkers

- Lipid panel
- Neuroendocrine panel
- Metabolism panel
- Cardiovascular panel
 - Genetics
 - RNA/Protein
 - Microbiome

Neuroimaging

- Structural
- Resting state
- Functional
- Monetary Incentive Delay
- Fear Conditioning

Self-report Measures

- State mindfulness
- State Affect
- Perceived stress

Orientation to mindfulness practice

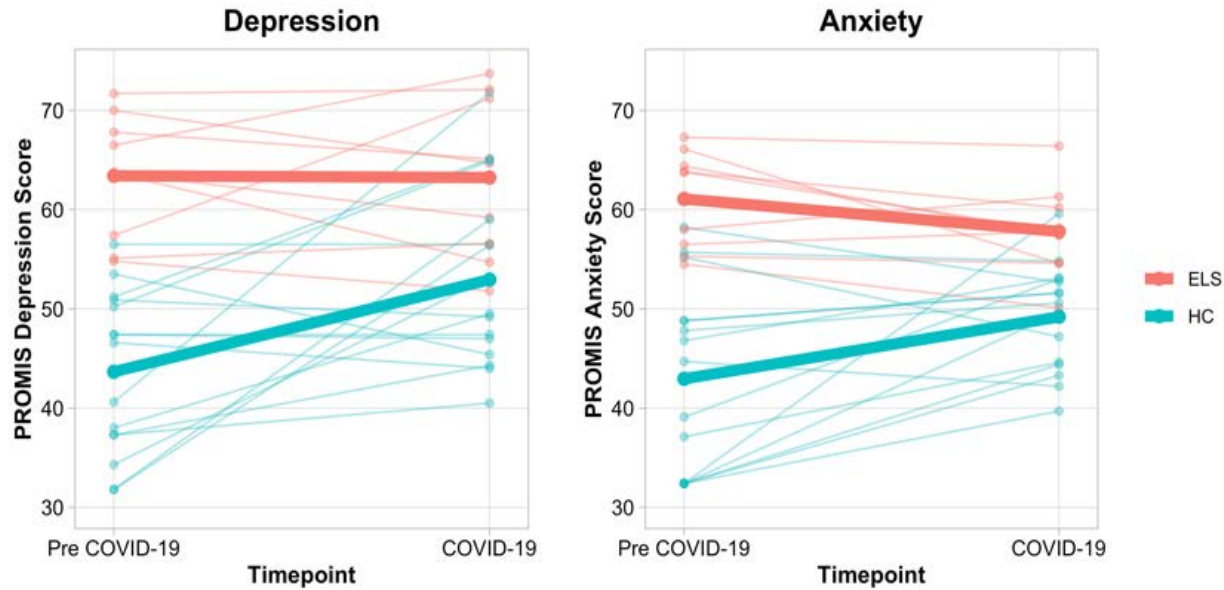

Mindfulness practice in the mock scanner

- Breathing practice

Neuroimaging

- Structural scans
- rtfMRI neurofeedback augmented mindfulness

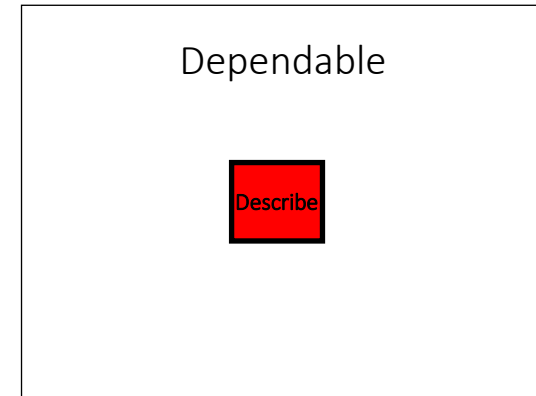

The COVID-19 pandemic has brought on far-reaching consequences for adolescents. Adolescents with early life stress (ELS) may be at particular risk. We observed significant increases in symptoms of depression and anxiety in healthy, but not ELS-exposed adolescents, which were maintained at one-year follow-up.

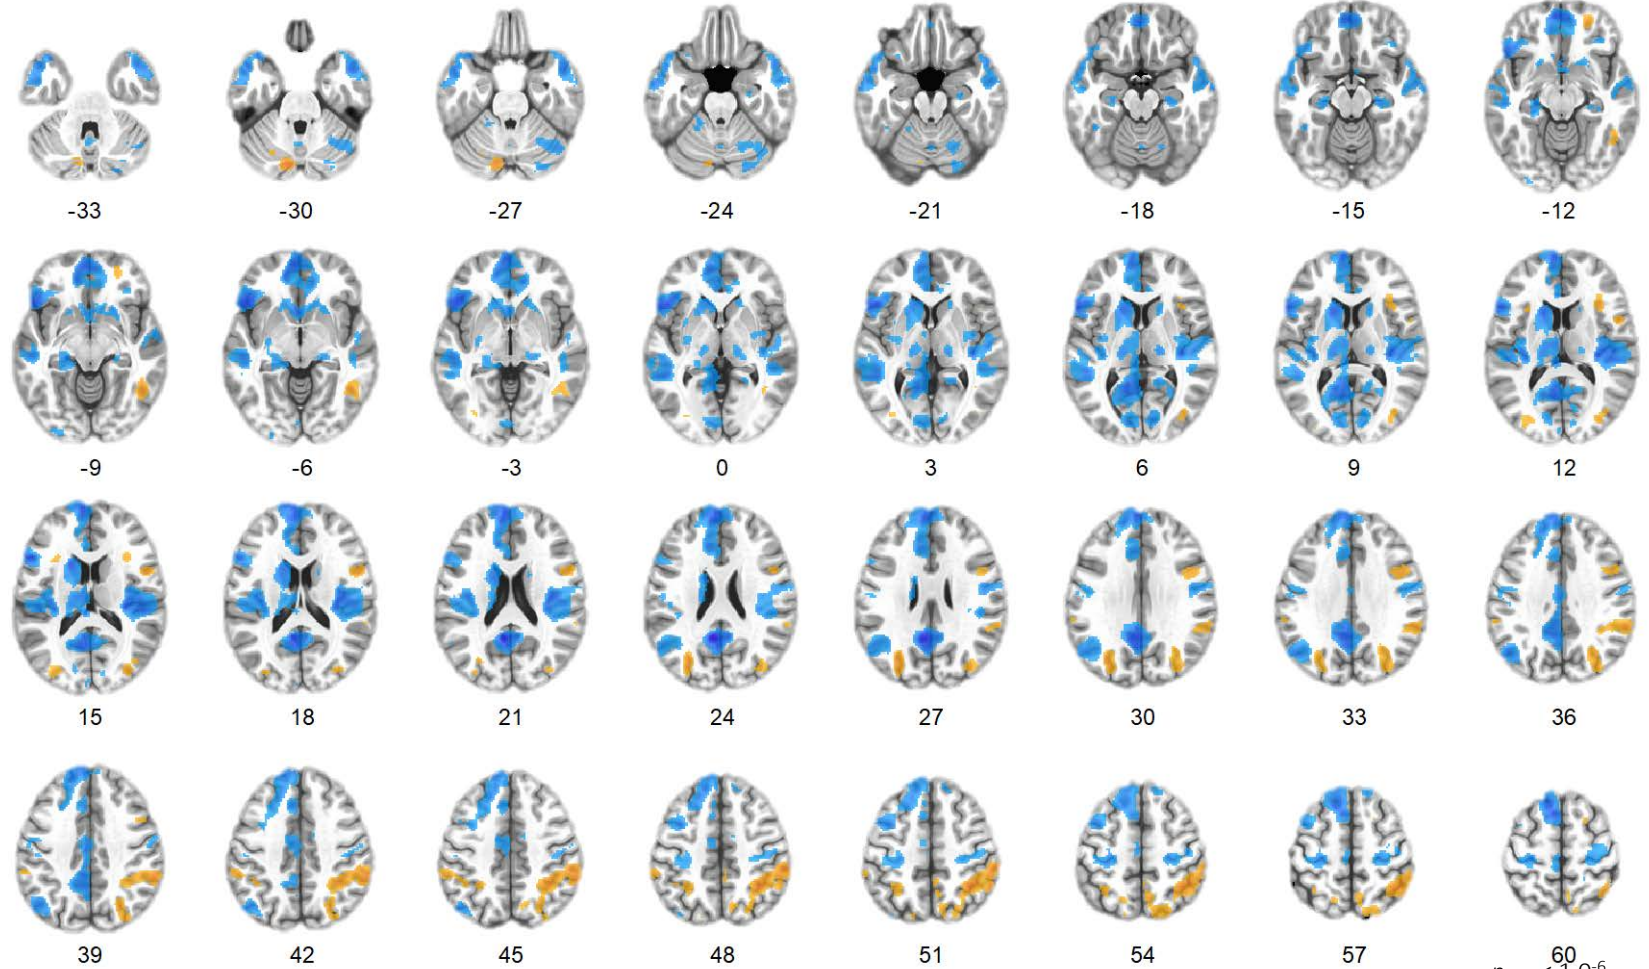

Left Posterior Cingulate

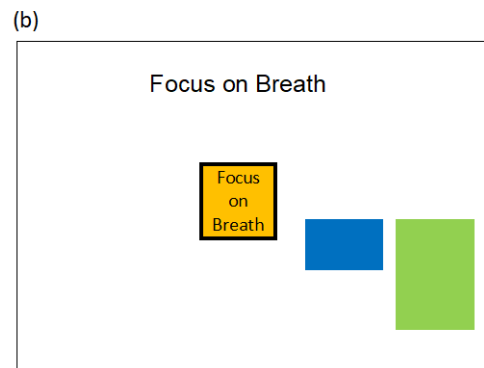

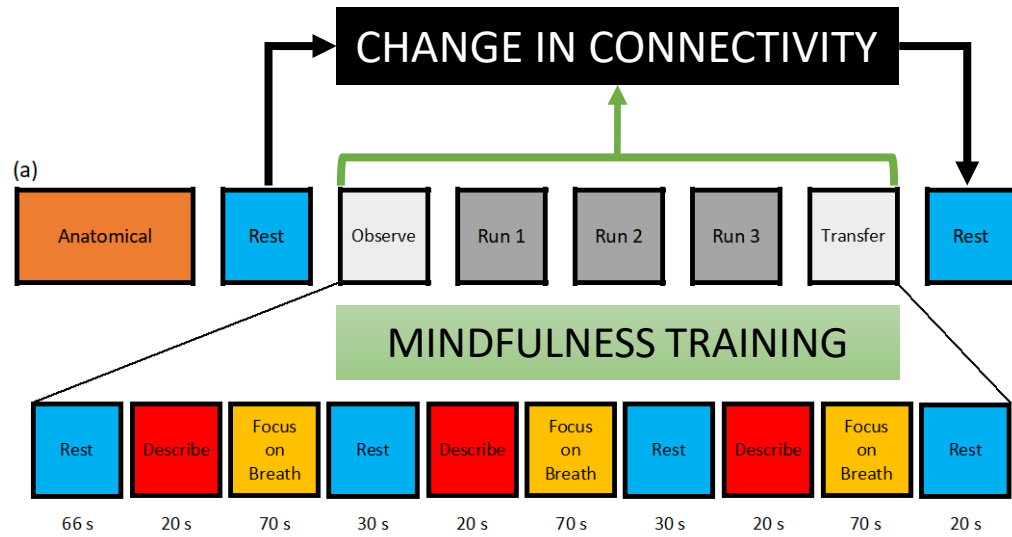

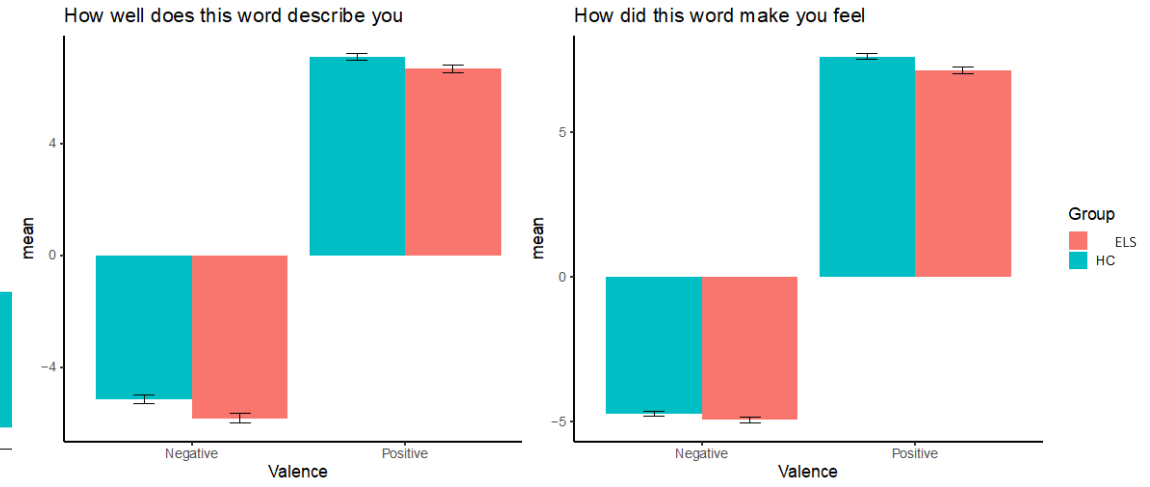

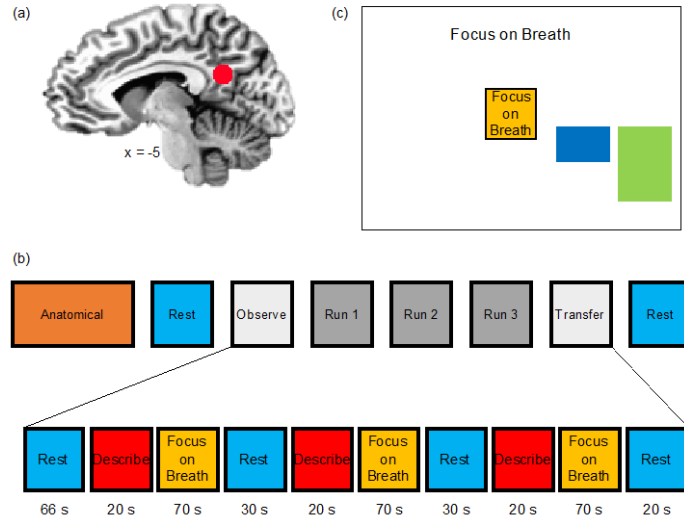

Dependable

Describe

Focus on Breath

- Our data shows that group mindfulness-based training is acceptable and feasible for adolescents with ELS exposure.
 - We found evidence for positive impact of mindfulness-based stress reduction on self-reported symptoms of depression among adolescents with ELS exposure.
 - We further found evidence for changes in cortisol response and stress perception following a stress induction task associated with mindfulness training in adolescents with ELS exposure.
 - ELS-exposed adolescents who completed mindfulness training also evidenced increases in emotional awareness and clarity.

- Real-time fMRI neurofeedback is an acceptable and tolerable approach to self-regulation of brain activity in adolescents.
 - Neurofeedback augmented mindfulness training is effective in deactivating PCC activity relative to self referential thinking.
 - Reduced activity in the PCC is related to activity in regions of the DMN and SN relevant for emergence and maintenance of psychopathology.
- Adolescents exposed to ELS are less successful in downregulating the PCC and show greater brain activity in regions involved in emotional processing during mindfulness practice relative to self-referential thinking.
- This may represent a mechanism by which early life stress exposure leads to psychopathology.
